

Software Engineer

Website | GitHub | LinkedIn | Email

Name and contact details available on request

Software Engineer with 3+ years building backend, mobile, and full-stack systems for fintech and healthtech products, including distributed APIs, LLM-powered workflows, and production cloud infrastructure.

Experience

Healthcare Fintech Startup *[name withheld]*

Brazil

Software Engineer

May 2025 – Present

- Automated medical invoice review for a billing platform serving **20,000+ physicians** by building a Python OCR and LLM processing pipeline with Ollama and AWS Bedrock and a React Native review workflow, transforming unstructured invoices into structured records for reviewer validation.
- Implemented AWS Cognito-based service-to-service authentication and a reusable Python client for JWT-authenticated internal API calls, replacing unauthenticated traffic between services across the platform.
- Built performance-sensitive APIs in Go and extended core billing workflows in a Ruby on Rails monolith, contributing to service boundaries and backend architecture from initial development through production launch.

Financial Services Company *[name withheld]*

Brazil

Junior Software Engineer

Dec 2022 – May 2025

- Reduced application latency by **15%** across production financial workflows used by **50,000+ users** by profiling Python request paths, optimizing database queries, and improving Angular rendering.
- Resolved **100+ production defects** across payment and transaction flows by owning triage from report through production release, improving reliability and reducing recurring support escalations.
- Drove accepted product improvements from data-backed proposals and technical specification through implementation and production release.

Projects

Fraud Detection API | *Go, Gin, NGINX, Docker*

May 2026 – Jun 2026

- Built a k-nearest-neighbor fraud detection API over **3 million labeled transactions** within a **1 CPU / 350 MB** limit for Rinha de Backend 2026, replacing PostgreSQL and pgvector with an in-process, int8-quantized IVF index packaged in the Docker image.
- Reduced each query from a full 3-million-vector scan to a bounded cluster scan by partitioning the corpus into **2,048 k-means cells** and tuning **nprobe** against a brute-force baseline to meet the target recall.
- Kept two API instances within the memory limit by memory-mapping the read-only index outside the Go heap, allowing both processes to share mapped pages behind an NGINX load balancer.

Rideshare Platform | *Go, Node.js, Java, React Native, Docker*

Dec 2024

- Independently built a rideshare system comprising three backend services—a Go trip-matching engine, Node.js API gateway, and Java notification service—plus a React Native app, covering flows from ride request through payment.
- Designed trip matching with geospatial indexing and a bounded Go worker pool to control concurrency, with contract-first REST APIs between components.

Open-Source Discord Integration | *Python, PyInstaller, Discord RPC*

Sep 2022 – Present

- Built and maintain an open-source Discord Rich Presence integration for a strategy game, reaching **2,720 downloads** across **12 releases** since 2022.
- Reduced setup effort for non-technical users by packaging self-contained PyInstaller executables with an installer, uninstaller, and self-updater; added automated tests to validate releases across game updates.

Technical Skills

- Programming languages:** Python, Go, Ruby, TypeScript, JavaScript, Java, SQL
- Backend:** Ruby on Rails, FastAPI, Gin, Node.js, Spring Boot, PostgreSQL, REST APIs
- Frontend and mobile:** React Native, Angular, React
- Cloud and infrastructure:** AWS, Docker, NGINX, Azure, Git
- Spoken languages:** Portuguese (native), English

Education

Private University *[name withheld]*

Brazil

Bachelor of Science in Computer Science

May 2022 – 2026
